APPLICATION FOR VICE PRESIDENT SOFTWARE ENGINEERING (GROUP)

Dear Alpega Hiring Team,

Modernising a platform toward cloud-native, API-first architecture while raising delivery velocity and embedding AI into daily engineering work is the mandate I have carried in every leadership role of the past five years, most recently as Engineering Director at sevDesk. The VP Software Engineering role at Alpega describes the same work at group scale — reporting to the CEO, owning engineering across the full product portfolio.

MODERNISATION AS AN EXECUTION DISCIPLINE

At Würth Cloud Services I led the migration of a grown legacy platform onto Red Hat OpenShift/Kubernetes inside a DAX-adjacent governance environment that had to move at start-up speed. At sevDesk I ran an application modernisation programme on Kubernetes/Docker in AWS in parallel with migrating the development infrastructure from GitLab to GitHub under a DevSecOps approach — the precondition for faster releases and fewer handoffs, the outcome your posting names as success.

ENGINEERING KPIS AND AI-ASSISTED DELIVERY

I introduced DORA-based engineering KPIs at sevDesk as a shared language between leadership, Engineering Managers and product — making deployment frequency, quality and cycle time visible and improvable. The GitLab-to-GitHub migration also laid the foundation for AI-assisted development tooling, work I continue today as Head of Consulting at Cloudfactory, advising 50Hertz Transmission on scalable platforms with AI-enabled workflows built in from the start.

LEADING ACROSS A PORTFOLIO

My largest single organisation is 40+ developers across six Engineering Managers at sevDesk — below the 100+ distributed SaaS organisation your posting describes, and I'd rather name that directly than overstate it. Alongside it, I bring portfolio-level ownership: at Cloudfactory I combine engineering delivery leadership with the Product Line PM Lead mandate across four platform products at 50Hertz, reporting into VP/C-level stakeholders and aligning roadmap and delivery across products, not just within one team.

Alpega's mission of giving shippers and carriers a trusted execution platform for road freight is the kind of problem I find genuinely interesting — real operational complexity and a market position that gives a modernisation mandate room to matter. I bring no prior TMS domain knowledge, but the pattern of taking a platform to a scalable, cloud-native foundation and building the organisation to sustain it transfers directly.

My salary expectation for this role is €155,000 per year. I am available at short notice and welcome the opportunity to discuss this further.

Best regards,

Dr. Tobias Griebel
